

Stripe track: Autonomous agentic commerce via Stripe infrastructure

Stripe rep for this track: [Mark Moriarty](#), Strategy and Experimental Projects @ Stripe

Prize amount: Stripe Credits + Lunch at Stripe HQ in Oyster Point + Swag

1. 1st place \$3k in credits
2. 2nd place \$2k in credits
3. 3rd place \$1k in credits

Stripe slack thread:

https://stripe.slack.com/archives/C077WH7Q88L/p1763144076117279?thread_ts=1762466600.356189&cid=C077WH7Q88L

TL;DR

Build something agents want! We're not prescriptive on what you should build today. Follow your curiosity. The Stripe prizes will be given out to folks who use existing Stripe products in the most creative ways.

We are excited to support any builder developing agentic flows which leverage Stripe for **funding, sending, or storing money**.

Judge's scorecard

Aspect of your submission	Judges' weight	Example
Creativity	30%	"Oh that's cool, I've never seen [Payment Links / Stripe Transfers / etc] used that way"
Works in prod	20%	"And you look at the dashboard, you can see the transaction / SMS / api call went through..."
Solves a real pain; solution could be a real business	50%	"You should keep working on this beyond today!"

If you're ready, get building! If you need inspiration, read on below.

Get help

There are >10 folks from Stripe and Privy floating around today, so if you need someone to look over your shoulder, flag someone down.

Peter Masone (pmasone@stripe.com) and Joel (joelkaracozoff@stripe.com) will be here all day.

Notes for participants

The opportunity

Agentic commerce will soon split into two worlds: **delegated** (humans involved) and **autonomous** (AI-to-AI). It's possible that autonomous agentic commerce makes up most internet transactions (by count) within a few years. Participants will build **fully autonomous agents** that discover, evaluate, and execute paid services/tool to accomplish complex end-to-end tasks *without human intervention*. The emphasis is on true economic autonomy: agents that can reason about cost vs. value, negotiate payments programmatically, and compose multi-step workflows where each step may require real-time payment settlement.

The core challenge: enable agents to transact in the economy as first-class participants.

Using Stripe

Creating an account

If you don't yet have a Stripe account, you can create a free one on stripe.com

Stripe docs

Vibe-coding: It can be helpful to point Claude Code / Codex / Replit / etc to specific Stripe docs. "Look specifically at the docs on these two pages and then...". Most Stripe documentation pages have an LLM-friendly version ending in .md.

 Copy for LLM |  View as Markdown

Notes for agents: <https://docs.stripe.com/agents>

Webhooks: Providers use webhooks to receive async updates. <https://stripe.com/docs/webhooks>

Stripe API Reference: Developers' best friend: <https://stripe.com/docs/api>

API keys: <https://dashboard.stripe.com/apikeys> (separate keys for live mode and each sandbox).

Testing in Sandboxes:

As you explore ideas and build out your project, you can work in a “sandbox” rather than in live mode. If you’re using v0 to get started, v0 will even spin up a sandbox for you to claim. You can use test payment methods while hacking today. (Bonus points for showing something working in prod by end of day!)

<https://stripe.com/docs/testing>

Payment Intents: A fundamental object / state machine that tracks a payment through to status “succeeded” (or not). <https://stripe.com/docs/payments/payment-intents>

Payment methods for an agent

There are variety of ways you can enable agents to move money *today*.

Stripe has a number of primitives such as Connect, Financial Accounts, and Issuing to help you get started.

Example 1: Give an agent a virtual card

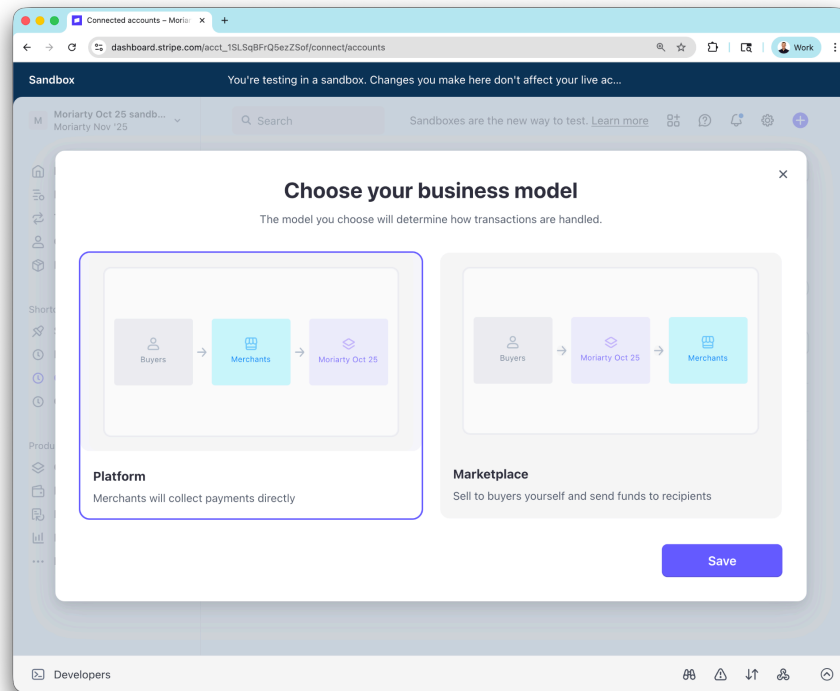

This is how Perplexity shopping works: Perplexity uses [Stripe Issuing](#) to complete user-initiated purchases with virtual credit cards.

<https://dashboard.stripe.com/test/setup/issuing/activate>

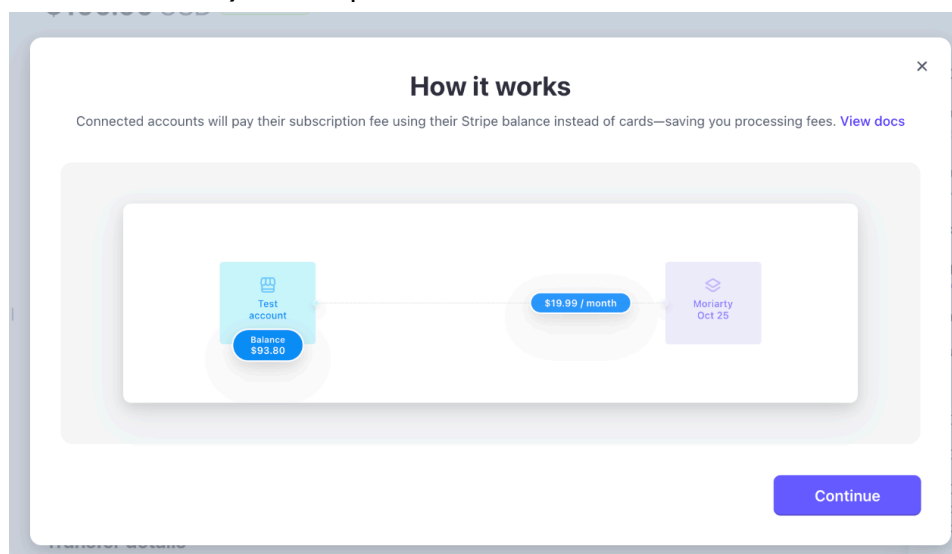

Example 2: Stripe Connect & Transfers

Enables agents to have economic identity via Connect accounts. Use transfer_data to route funds directly to tool providers. <https://stripe.com/docs/connect/charges-transfers>

- Create a new Stripe account
- Set up “Connect” on <https://dashboard.stripe.com/connect>
- Set up as a “Platform” (not a “Marketplace”)

- Now you can easily do “transfers” from any connected account balance to your platform balance
- For the sake of your demo, you can now send money (in live mode or test mode) between two or more entities (Connected Accounts → Your Platform account). Your demo presentation might include the line, “Now imagine if Stripe enabled Account to Account transfers between *any* two Stripe accounts...”.

- <https://docs.stripe.com/api/transfers>

Example 3: Crypto/stablecoin payments

Bridge and Privy are Stripe portfolio companies; if you're already a user of either, we'd love to see new creative tools built today.
